

The science of nuclear physics is presently moving to a death end. It is thought of approaching the unitation of all natural powers (at moment of big bang) by higher energy and enormous (expensive) machines.

In fact, the nature cannot be violated and raped by destruction of materiel elementaries, respectively cannot be explored by examination of shortlife hypothetic particles.

However, the creative human mind alone (just as well so a part of nature) may be capable to solve the puzzle of the triple connection of energy - original substance - specific substance.

HEISENBERG writes mid of the last century in one of his books: "The relativity theory is connected with an universal natural constant, the speed of light. This constant is of decisive importance for the relation between space and time." The relativity theory takes also the mass as form of energy and then postulates the deviation of light with highest possible velocity by gravitation fields.

ref. to formula $E = m \cdot c^2$

HEISENBERG writes further: "The quantum theory is connected with another universal natural constant, the Planck effect quantum." The quantum theory controls especially the phenomenons in the atomic range, namely the orbits of electron around the atomic nucleus.

ref. to formula $E = h \cdot f \text{ ---> } P = h / 2\pi$

HEISENBERG finally writes: "There must be still a third universal natural constant, and a theory only, which contains such a third unit can possibly lead to determination of the masses and other properties of elementary particles."

This theory already exists towards the end of the past century under the name of CONFORMITY THEORY. Only now this theory offers the explanation of cohesion of the substance in the atomic nucleus by the so called etheric pressure (gravitation wind) around a black hole in the center of each galaxy.

ref. to formula $E = p \cdot V = m \cdot c^2 \text{ ---> } p = d \cdot c^2$

On the other hand there is EINSTEIN with his theory of gravitation, which he wanted to build above his general relativity theory, who experienced serious problems. In grieve evidently, he left word, that the future physical science may eliminate any formula and instead will return to simple connections, eventually having the entire natural science to collaps like a card house.

Perhaps the relativity theory and the quantum theory had to be invented first in order to make the CONFORMITY THEORY possible. Because, if all the three theories are being connected, the results is an always wanted universal formula, the world formula (or the world relationship).

c for relativity theory,
h for quantum theory,
r.m for conformity theory

$r \cdot m = 3 h / 4 c$
original substance - neutron

With the CONFORMITY THEORY a fourth strong field becomes evident, the impulse field at moved masses. The generation of gravity waves and the explanation of the neutron decay is as well a product of this third theory. The elementary particles now will be limited to to neutrons, protons and electrons as stable concentrations of energy.

$$r a m = \frac{3h}{4c}$$

r radius
a atrophy
m mass
elementary particle

h Planck constant
c light speed
